

Download Arthrogyryposis A Text Atlas

The major cause of arthrogyryposis is fetal akinesia (ie, decreased fetal movements) due to fetal abnormalities (eg, neurogenic, muscle, or connective tissue abnormalities; mechanical limitations to movement) or maternal disorders (eg, infection, drugs, trauma, other maternal illnesses). Arthrogyryposis (multiplex congenita) is a clinical or imaging descriptor that denotes congenital non-progressive joint contractures involving two or more body regions. Epidemiology It is thought to occur in approximately 1:3000-10,000 live bir... Due to the overwhelming registration response to our Conference and size constraints of the venue, AMCSI was forced to close registration for the 13th Annual Conference in Columbus, OH earlier than planned. Unter Arthrogyryposis multiplex congenita (AMC) wird eine angeborene Gelenksteife (Dysmorphie) verstanden. Der Begriff steht für das Zustandsbild.
